

Help Menu ESS Workflow:

- A. The show help button is clicked with id **#iniHelp**, showing help icons for some of the content in the page
- B. The user clicks a help icon (with class **.helpMenu**)
 - a. **.helpMenu** event handler is triggered, which gets the data-what-help attribute value from that button and passes it to the **Help.openHelpReveal**, which opens an empty reveal, and to the **Help.fillHelpReveal**, which runs an ajax post.
 - i. **fillHelpReveal** posts the data-what-help attribute value to the backend **controller helpMenu function**, which responds with the view that matches the passed value. Ex. if data-what-help = helpHTML, the response will be helpHTML.html.
 - 1. The response is then placed into reveal using the id **#helpContainer** to replace reveal content.
